November 2006

# SHEAR FLOW INSTABILITIES IN SHALLOW FLOWS

## CLASSES OF INSTABILITY

- *Absolutely Unstable*
- *Convectively Unstable*
- *Stable*

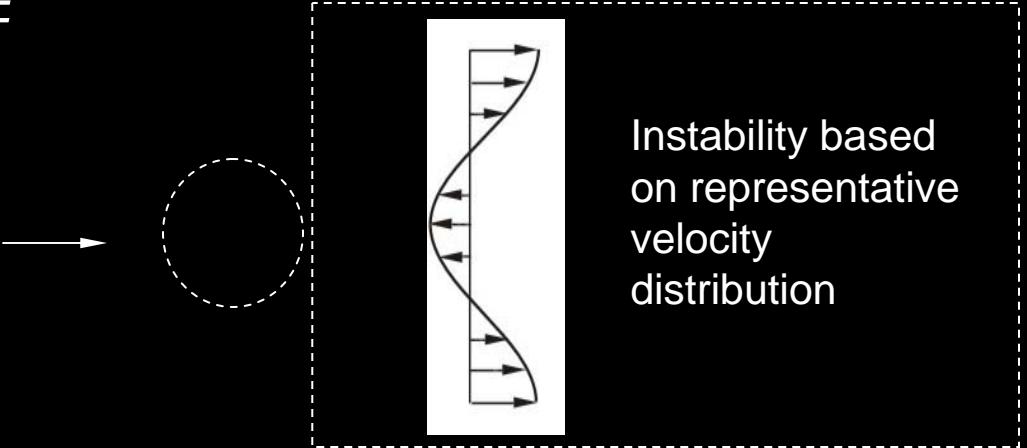

## PHYSICAL CONSEQUENCE OF INSTABILITY (OF A WAKE)

- *Large-Scale Vortex Street*
- *Unsteady Bubble Wake*
- *Unsteady Bubble Wake with Downstream Instabilities*
- *Steady Bubble Wake*

# SHEAR FLOW INSTABILITIES IN SHALLOW FLOWS

## INSTABILITY IN ABSENCE OF CYLINDER

- *Absolutely Unstable*
- *Convectively Unstable*
- *Stable*

Instability based  
on representative  
velocity  
distribution

## INSTABILITY IN PRESENCE OF CYLINDER

Instability may be  
influenced by, or  
coupled with, upstream  
region of flow

Region of distortion/  
separation/ amplification

# VORTEX FORMATION IN SHALLOW FLOWS

## *VORTEX FORMATION*

- *IN UNSTABLE SHEAR FLOW*
- *VIA CONTROLLED GENERATION*
- *COUPLED WITH WAVE SYSTEM*

D . Rockwell, H. Fu, A. Ekmekci,  
November 2006

## SYSTEMS AND APPROACHES

### *FLOW SYSTEMS*

Flow (water) systems with three-D optical access

### *QUANTITATIVE IMAGING*

- Techniques of high-image-density particle image velocimetry (PIV)
- Whole field representations of quantitative, instantaneous and averaged flow structure.

### *POST-PROCESSING OF QUANTITATIVE IMAGES*

Cinema sequences of images: space-time representations of flow structure.

# VORTEX FORMATION IN SHALLOW FLOWS

## OVERVIEW

*Highly coherent vortex formation in shallow flows due to:*

- (i) *Classical absolute instability of near-wake*
- (ii) *Global instability of entire system of distorted flow about body and near wake*
- (iii) *Convective instability triggered and reinforced by gravity wave resonance*
- (iv) *Eruption of boundary layer from bed at leading-edge of nominally two-D vortex*

*Viewed in isolation, formation of highly robust coherent vortical structures due to (ii) and (iii) mimics features of (i).*
