# Principal take aways:

- **“Energy Critical Elements”** – a new category of chemical elements with common economic & scientific issues
- **“Running out”** – in general not the issue
- **Constraints on availability; interruptions in supply** – are the issues
- **Domestic (US) mining** A component of a rational ECE policy, but no single country can/should want to be self-sufficient
- **Features of a well-conceived federal policy:**
  - Information** – gather, digest, distribute information across the supply chain
  - Research** – across the supply chain, from geophysical to substitutional, physics, material science, engineering, policy...
  - Recycling** – “More precious than gold”, unsolved technical and economic problems

# I Energy Critical Elements (ECEs)

- Increasing demand for energy
- Anthropogenic climate change

EIA International Energy Outlook 2010

The time series of atmospheric CO<sub>2</sub> concentration at Mauna Loa, Hawaii, started by Dave Keeling in 1958. WHOI

National Oceanic and Atmospheric Administration

- Increasing demand for energy
- Anthropogenic climate change

New technologies for harvesting, transmitting, storing, or conserving energy!

Imaginative scientists & engineers

Employing the whole periodic table

Lab ⇒ Pilot ⇒ Massive Deployment

Materials intensive

Shortage? ⇒ Inhibit, derail?

Not been widely extracted, traded, or utilized in the past  
 Not the focus of well-established, robust markets.

## Conversion of electric lighting to compact fluorescent

YOUR GOVERNMENT AT WORK

### Congress bans incandescent bulbs

Massive energy bill phases out Edison's invention by 2014

Posted: December 19, 2007  
7:18 pm Eastern

In addition to raising auto fuel efficiency standards 40 percent, an energy bill passed by Congress yesterday bans the incandescent [light bulb](#) by 2014.

# Tb

Terbium and europium provide phosphors that allow CFLs to approximate incandescent spectrum

Annual Global Production of New Metal			
2008	$\Delta$ (%)	2009	$\Delta$ (%)
450 Tons	0.0	450 Tons	0.0

Doubling phosphor demand would require increase of ~375 tons of Tb<sup>†</sup>

# Why not aluminum? Resources are broadly distributed.

# Al

**World's leading aluminum-ore producer (Australia, 33%)**

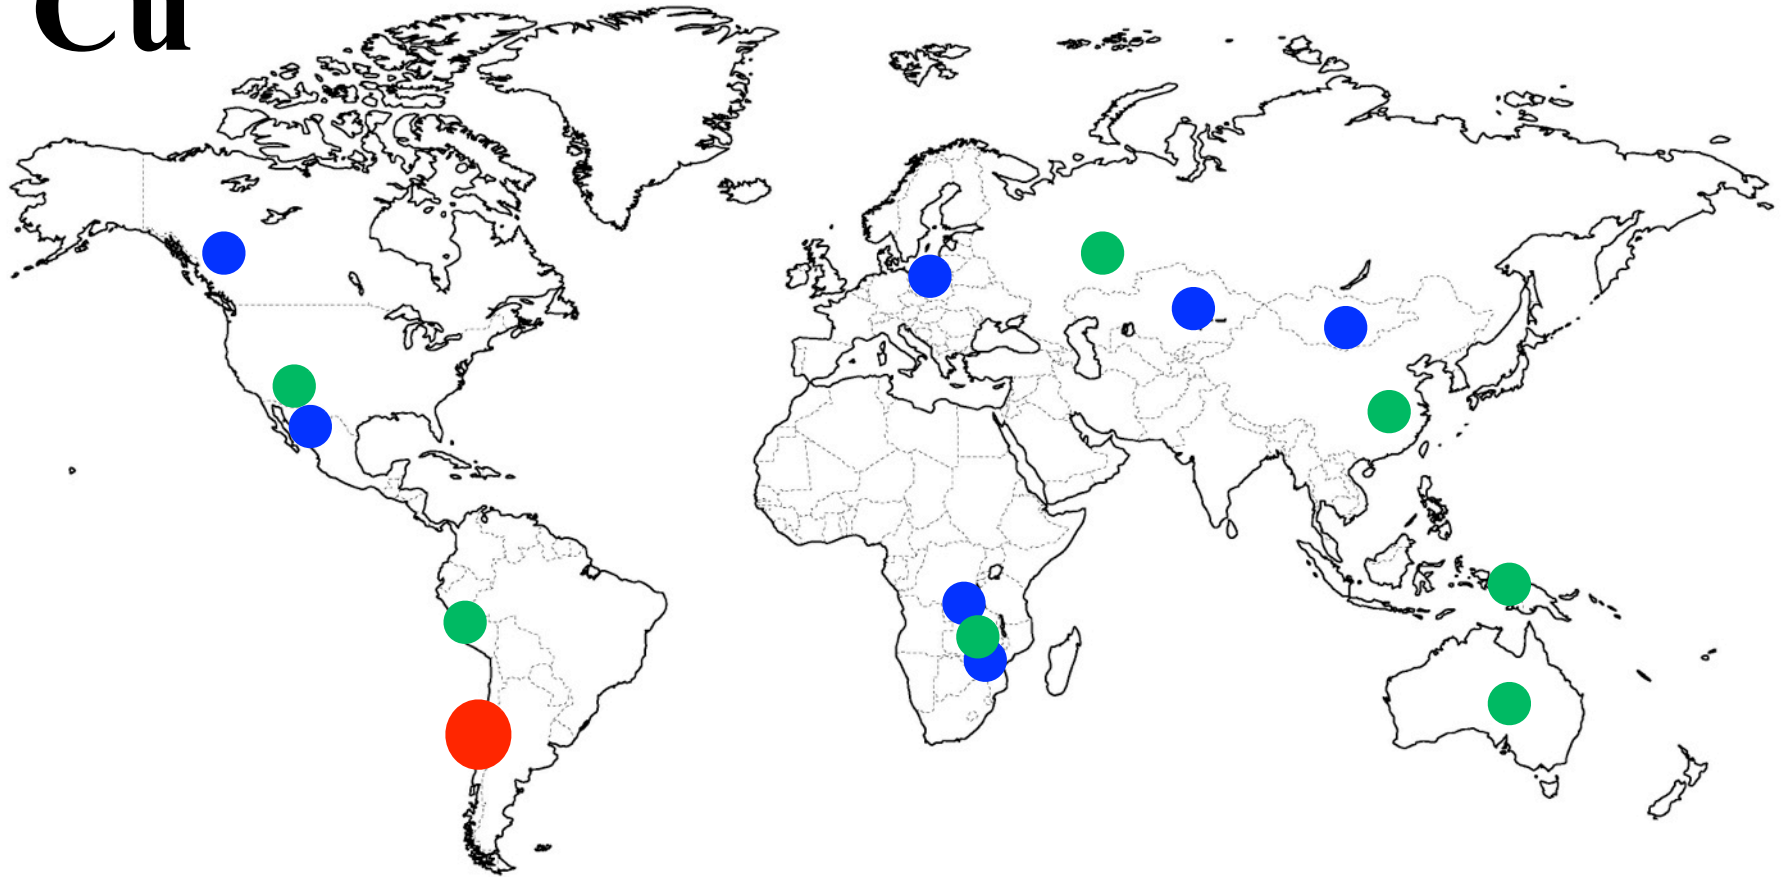

**Countries with 4% or more of global production**

**Other countries with production or major reserves**

# Why not copper? – resources are broadly distributed

## Cu

**World's leading copper producer (Chile, 34%)**

**Countries with 4% or more of global production**

**Other countries with production or major reserves**

## II Some comments

- The world isn't running out of any ECEs anytime soon.

Claims to the contrary based on misunderstandings of “reserves”

\* D. Cohen, *New Scientist*, May 2007

~~“Mine, baby, mine!”~~

Clearly (environmentally acceptable, socially responsible) domestic mining is part of the solution, but...

No country can become “ECE independent”

Nor should one want to be: international trade benefits everyone

2010 U.S. NET IMPORT RELIANCE FOR SELECTED NONFUEL MINERAL MATERIALS

USGS 2011 Mineral Commodity Summary

- ~~Stockpiling~~ disincentive to innovation, unintended economic consequences.
- In the grand scheme of things, each element will go through the process of adjustment of application to abundance that has happened (and recurred) for better known elements in the past

## Gold and Aluminum

# III. ECE's: Constraints on availability

## Absolute abundance & concentration

**GERMANIUM...**

Though not intrinsically rare, they are not mineralized efficiently by geological processes, and do not occur in viable ores.

## ★ Geopolitical risks

**RARE EARTHS (REEs) & PLATINUM GROUP**

- Chance has concentrated them in one or two large or rich deposits.
- Complex economics and politics have led to dominance of a single or small number of countries, allowing market manipulation and raising political issues.

## ★ Risks of joint production

**INDIUM, GALLIUM, TELLURIUM...**

They are only recovered as by-products in extraction of more common metals. Raise a host of (fascinating) economic issues (viz. tellurium)

## ★ Environmental and social concerns

**REEs...**

Developed world will not accept environmental disruption. Countries willing to tolerate environmental degradation for short term gain can dominate markets. Rising environmental consciousness renders this unstable.

## Response times in production & utilization

**LITHIUM, LANTHANUM**

It takes 5-15 years to bring new sources online and/or research and develop substitutes.

# ABSOLUTE ABUNDANCE & CONCENTRATION

- 12 “rock forming elements” account for > 99% of Earth’s crust.
- Local enrichment of scarce elements by substitution, eg. Se & Te for S
- More frequently isolated substitution into crystal structure
- Well known rare elements --- gold, silver, platinum --- usually have exceptional chemistry
- Issues:
  - poorly understood geology, prospecting
  - low grade ores
  - unfamiliar metallurgy
  - greater waste and environmental problems

16 <b>S</b> Sulfur 32.07
34 <b>Se</b> Selenium 78.96
52 <b>Te</b> Tellurium 127.60

## Germanium

0.00015%, 140 t/yr, ~\$1000/kg

Price limits use in PV to high end CSV (concentrated solar voltaics)

# GEOPOLITICS

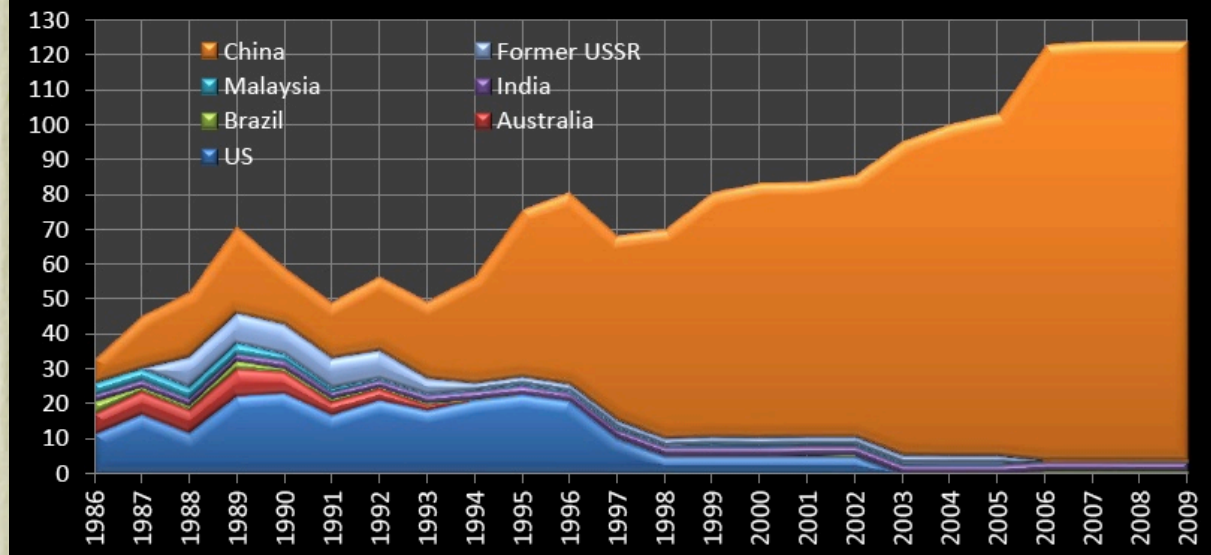

- Reliance on imports is not a priori bad
- US relies on imports for over 90% of most ECEs
- Problems arise when **happenstance** or **monopoly economic policies** concentrate production in one or a very few countries
- Platinum & palladium: World's reserves are overwhelmingly concentrated in SA (Bushveld complex). Production dominated by SA and Russia.

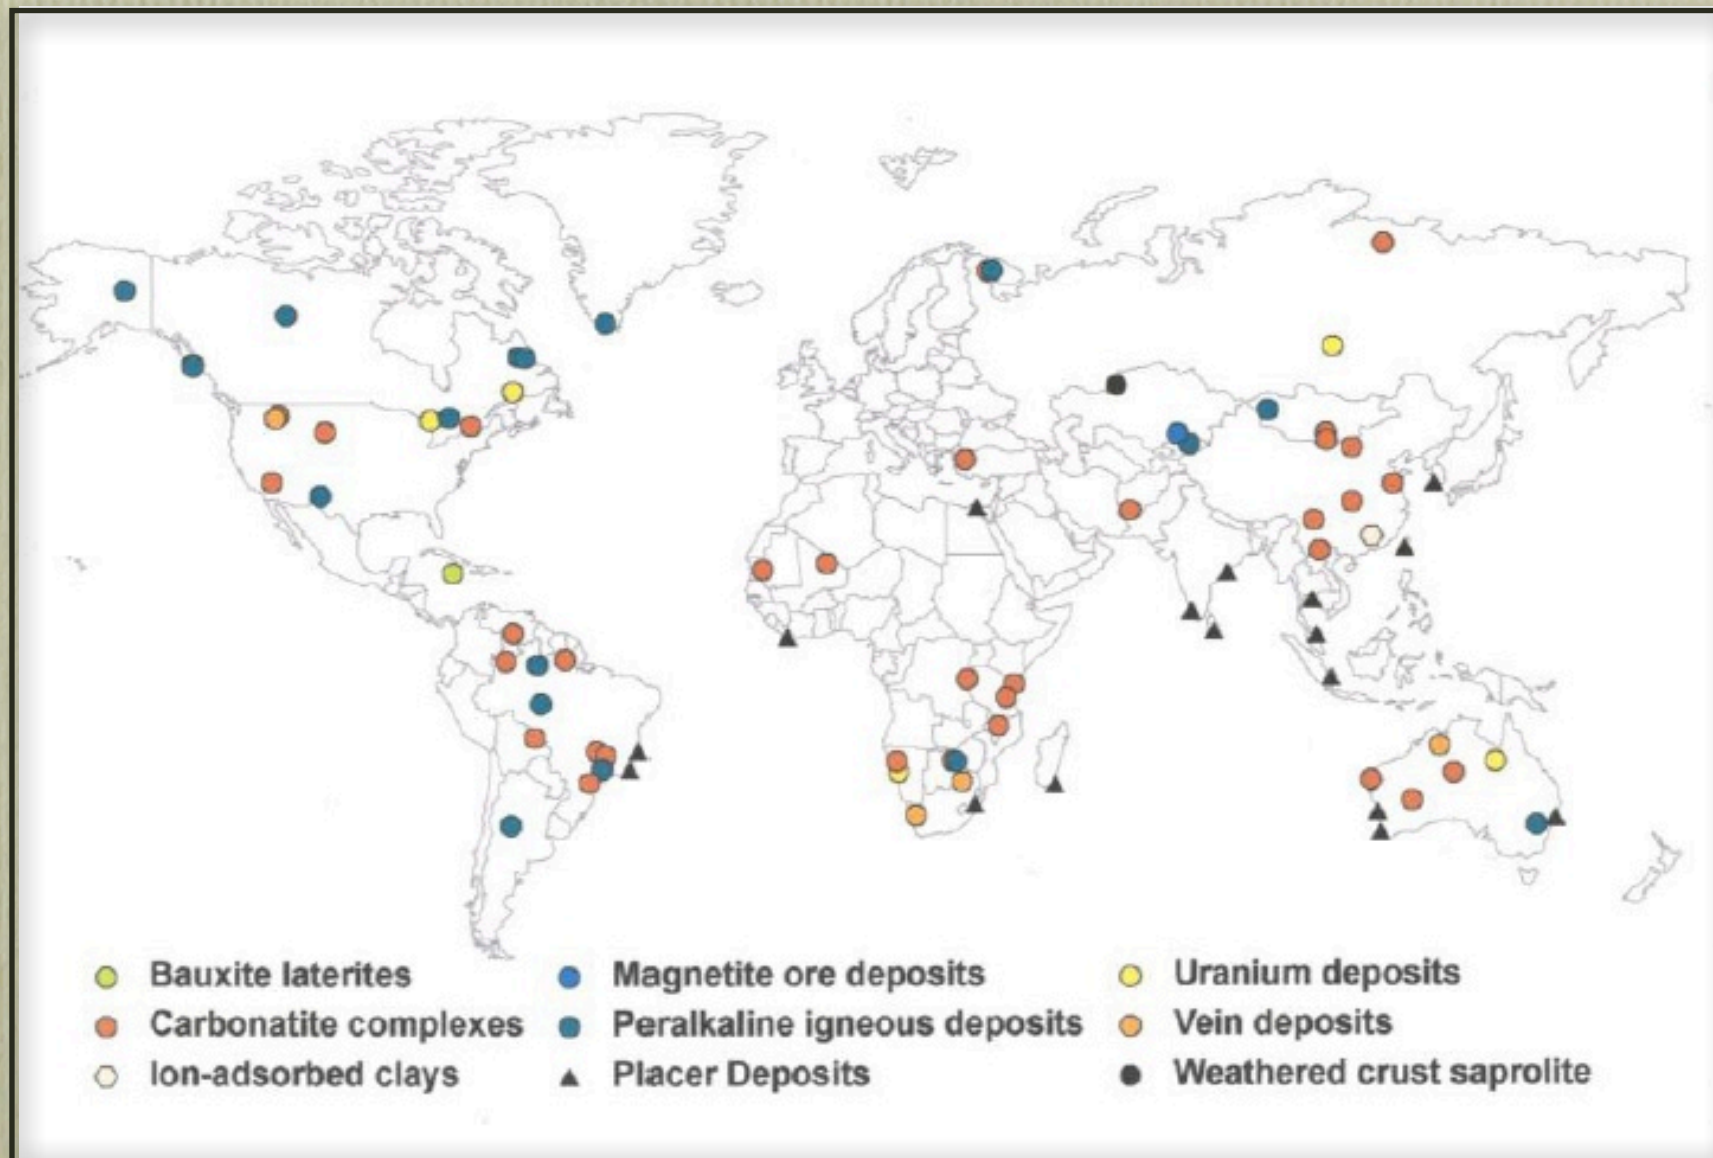

## Rare earth elements

0.007 -- 0.00005%, 130 Kt/yr

95% produced in China,  
including all HREE

Global REE Production 1986-2009 (kt/year)

分析  
能“走  
“中  
East

A. Mariano, private communication

# COPRODUCTION ECONOMICS

- Many ECE's are now produced entirely as by-products of the refining of major metals.
- **Tellurium** (copper), **indium** & **germanium** (zinc), **gallium** (aluminum)
- Prices are artificially low (economy of scope) until the coproduction saturates. By-product does not drive production of main product. Price demand inelasticity.

## Tellurium

0.0000001%, ~200 -- 500 t/yr,

~\$150/kg (!)

Key ingredient in CdTe PV --  
quickly gaining market share.

SUPPLY

PRICE

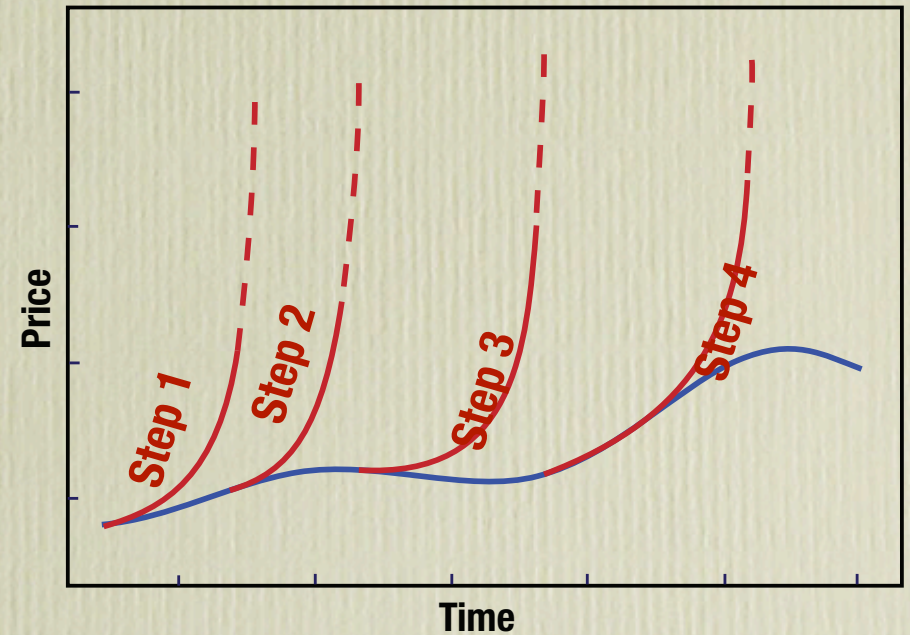

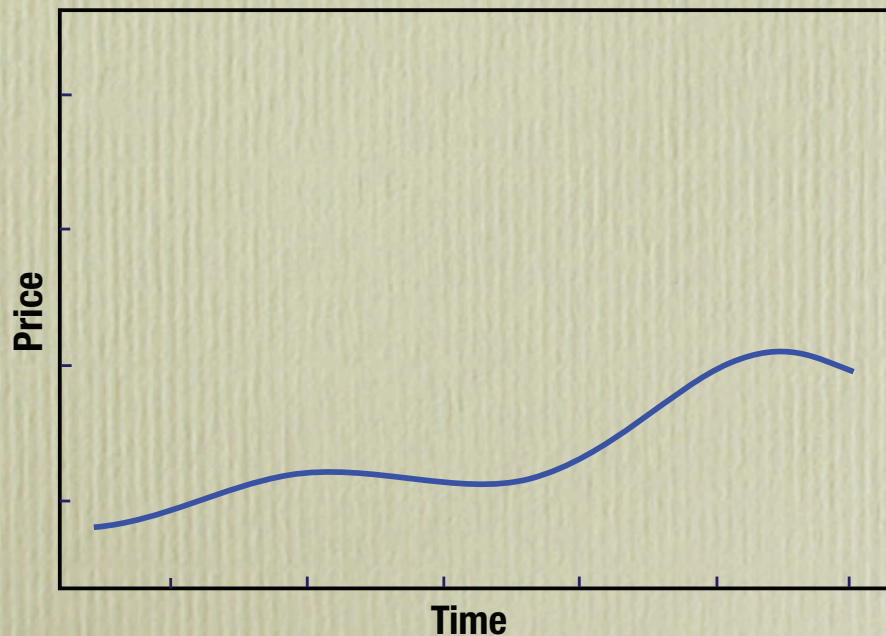

# Example — tellurium — coproduction with copper

	Main product	Byproduct
	Cu	Te
Global production (metric tons)	16,200,000	200 -- 500 ?
Price (\$/kg)	\$7.50	\$210
Value of global production (\$)	$\$122 \times 10^9$	$\$105 \times 10^6$
Ratio of global value to Cu		1200:1

# Example — tellurium (continued)

- Step 1** Increase Te recovery from electrolytic copper refining
- Step 2** Replace Te in traditional applications
- Step 3** Recover Te from other sulfide ores (Zn, Pb, ...)
- Step 4** Shift Cu refining away from solvent extraction
- Step 5** Mine and refine (low percentage) primary Te ores

## COPRODUCTION ECONOMICS (CONT'D)

- The special case of the rare earths!
- The REE are all co-produced with one another.
- LREE (Sc, Ce, Pr, Nd, Pm, Sm, Eu, Gd) versus HREE (Y, Tb, Dy, Ho, Er, Tm, Yb, Lu)
- Some REE will always be in undersupply, while others will always be in oversupply

# ENVIRONMENTAL AND SOCIAL CONCERNS

- Decades of increasing vigilance w.r.t. externalities, esp. environmental and social.

	Bastnaesite Mt. Pass	Monazite Australia	Xenotime Malaysia	Monazite Australia
$\text{La}_2\text{O}_3$	26.06	11.55	1.75	13.46
$\text{CeO}_2$	36.81	25.66	4.22	27.20
$\text{Pr}_6\text{O}_{11}$	3.02	2.98	0.51	2.98
$\text{Y}_2\text{O}_3$	0.04	0.83	30.86	1.17
$\text{ThO}_2$	0.09	5.73	1.26	6.5

## ENVIRONMENTAL AND SOCIAL CONCERNS (CONT'D)

- History of U. S. Mountain Pass, California REE mine.
- Once was world's leading producer of REE; first operations in early 1950's; large scale in 1960's through 1990's
- Thorium & radium contamination of wastewater spills caused closing of mine in 1990's
- Molycorp has been trying to reopen the mine for better part of decade.

**Desert Tortoise**

**Evaporating pools**

**Major new facilities**

**Permitting, stakeholder buy-in**

**\$500M in financing**

## RESPONSE TIMES IN PRODUCTION AND UTILIZATION

- 5 -- 15 years from certification of resource to production of refined metals.
- 5 -- 15 years from conceptual design to production for novel technology

### Batteries for all electric vehicles

- Lithium or NiMH?
- Lithium or Lanthanum?
- Typical Toyota Prius uses 10 – 25 kg of La
- Chevy Volt uses 400 lb of Li-ion batteries
- **Which technology will win?**

### Lithium

0.002%, ~ 25 Kt/yr, ~\$70/kg

Possible technology route for all-electric vehicle batteries

### Lanthanum

0.004%, ~ 39 Kt/yr, ~\$100/kg

Possible technology route for all-electric vehicle batteries

# Interlude: The story of Rhenium: Information / Research & Development / Recycling

The search for a low rhenium content turbine alloy for CCGT (Brayton) cycle power

But Re is extremely rare

~ 25 kg Re per gas turbine

Rhenium 10 Years On ©Anthony Lipmann (2005)

GE (major turbine manufacturer and Re consumer) anticipated supply constraint and launched a two pronged program in 2005:

- Recycle pre-consumer scrap to forestall shortage
- Develop new, low (zero?) content Re alloys
- Success over 5 years.

P. J. Fink, J. L. Miller, and D. G. Konitzer, J. Minerals Metals Mater. Soc. 62, 57 (2010).

## IV. Moral of the Rhenium story and study policy recommendations

- **Information** .... GE knew the Re market in detail from years of study
- **Recycling** .... GE had the waste stream from decommissioned turbines and preconsumer scrap, and the high-tech expertise to extract Re from scrap alloys
- **Research** .... GE had the resources to mount a long range research effort on substitution
- Most companies do not have these resources, nor do university researchers.
- A legitimate role of government...

# Recommendations for federal policy

## I. COORDINATION

**Complex, multi-dimensional issue: COMMERCE, DEFENSE, ENERGY, INTERIOR (USGS), STATE, TRANSPORTATION, EPA, OMB, COUNCIL OF ECONOMIC ADVISORS, US-TRADE REPRESENTATIVE...**

**Executive Office of Science and Technology Policy (OSTP) should coordinate federal response.**

## **II. INFORMATION**

**High quality information is extremely valuable, promotes transparency.**

**Federal government should gather, analyze, and disseminate information on ECEs**

**From discovered and potential resources, to production, use, trade, disposal, and recycling.**

**Model ~ EIA**

**Regularly survey emerging energy technologies and the supply chain for elements throughout the periodic table, with the aim of identifying critical applications as well as potential shortfalls.**

### **III. RESEARCH, DEVELOPMENT, AND WORKFORCE**

**Federal R&D: focused on energy-critical elements and possible substitutes.**

**GEOLOGICAL DEPOSIT MODELING, MINERAL EXTRACTION AND PROCESSING, MATERIAL CHARACTERIZATION AND SUBSTITUTION, UTILIZATION, MANUFACTURING, RECYCLING, AND LIFE-CYCLE ANALYSIS.**

## **IV. THE ROLE OF MATERIAL EFFICIENCY**

**The federal government should establish a consumer-oriented “Critical Materials” designation for ECE-related products. The certification requirements should include the choice of materials that minimize concerns related to scarcity and toxicity, the ease of disassembly, the availability of appropriate recycling technology, and the potential for functional as opposed to non-functional recycling.**

**Steps should be taken to improve rates of post-consumer collection of industrial and consumer products containing ECEs, beginning with an examination of the numerous methods being explored and implemented in various states and countries.**
